SUPER-COMPACT UP TO 14 m

Socage presents the brand new A314 mounted on Renault Maxity/Nissan Cabstar 3.5 ton, wheelbase length just 2500 mm

The newly developed A314 aerial platform was primarily designed for off-road & pick-up vehicles.

Socage have now installed the A314 onto the new Renault Maxity / Nissan Cabstar to produce the "super-compact" with a really short wheelbase of only 2,5m, the total length of this machine is just 4,5m, the width being 1,9m, this is a real market sector record.

The maximum working height is 13,5m and the outreach is 6,5m, these performances are obtained with the larger 225kg basket capacity. This aerial platform has 360° unlimited slewing, this allows the operator to rotate without interruption in the same direction, and this feature improves productivity and reduces mewp re-deployment time.

This brand new A314 Renault / Nissan is equipped with the "EASYLIFT" stabilization system. The Socage patented system facilitates the stabilization process and reduces the outrigger deployment time. The deployed outriggers do not exceed the vehicle width; this allows the MEWP to be stabilized inside a normal car parking space.

This aerial platform and chassis combination has been requested by rental companies.

Owing to the shorter wheelbase and overall compact size of the unit, this naturally affords the hirer an easier driving experience within the urban environment, perfect for the long term and spot hire markets.

30 TONS ON 18 TONS TRUCK

Socage begins the manufacturing process of the brand new TK truck crane series

This TK30 truck mounted crane has passed its final testing, ready to be delivered to its proud new owner. This TK30 is mounted onto an 18 ton truck chassis. The TK30 can easily handle a maximum load moment of 30

tm.

Not only does the TK30 offer extreme compactness of installation, it also offers many features normally found on larger cranes like the special stabilization system which allows the crane to operate even in narrow spaces with excellent loading capacity.

"TK series" cranes can be equipped with heavy duty fly-jib which enables the crane to reach 40m working height. This particular hydraulic jib allows the crane a massive 35,2 m of outreach.
